

Lesson 1

次の英文を読んで、以下の問いに答えなさい。

Latin and Classic Chinese, the languages of the two gigantic intellectual communities of Europe and East Asia, have now passed into disuse. In both areas, if anything has replaced them as an international language it is English, which has become the language of science so universally that it seems without peer in the history of our planet. The reasons have little to do with any inherent merits of English itself. It is not easier to learn or to use than other languages — indeed it may be harder than most — and it is not any more logical or less ambiguous than the others. Its present position seems to derive primarily from two facts. First, it is the language of England, home of the Industrial Revolution and seat of the once extensive British Empire. Second, it is the language of the English-speaking diaspora, and particularly of the United States, a country blessed with natural resources in an era when growth of industry made it easy to turn them into wealth. ⁽¹⁾ Whatever the historical details and whether or not English retains its premier position for very long into the future, it is evident that today more scientific communication — articles and lectures — takes place in English than in any other language in the world. This point was emphasized when an eminent European biologist, addressing colleagues during a visit to the United States, prefaced his heavily accented lecture by announcing that he would deliver it in “the international language of science: broken English.” ⁽²⁾ There is much truth in this modest joke.

[Note] gigantic: very large, enormous, huge

Looked at from the outside, writing is the act of joining words into sentences on paper. To anyone who's ever tried to write, that's a misleading definition. Certainly a large part of composing takes place in the mind. But if writing isn't just exercising the fingers, neither is it necessarily the act of finding words to express definite, fully formed ideas. For some writers (イ)(ロ) — they “think the whole thing out” before they put words on paper. For others, the physical act of writing stimulates their thinking and gives them ideas. Like E.M. Forster, they ask, ^(a)“How can I know what I think until I see what I say?” (Another writer, Joan Didion, has said, “I write entirely to find out what I'm thinking, what I'm looking at, what I see and what it means.”) Whatever the action, whether external or internal or both, this initial stage of composing may be called “prewriting.” Without sustained and inventive prewriting, a good paper can (ハ) be a lucky accident.

Prewriting is discovering what you think and feel about your subject; it's finding the perspective from which you'll write about it. It includes whatever (ニ) on before you make a purposeful effort to produce a first draft. Depending on your subject and your habits of work, prewriting may be a period of thinking that ranges from idle musing to hard concentration. Or it may include talking, reading, taking notes, making more or less systematic outlines. Or ^(b)it may mean scribbling away in an attempt to get at a hazy notion that could turn out to be the core of what you write. Some of us (ホ) on paper.

問2 下線部(a)の疑問文が期待しつつある答えを、文中に“it”の語を含む形の英文で表せ。

問3 下線部(b)を和訳せよ。なお、it の訳語を「それ」とすること。

Lesson 3

次の英文について設問に答えよ。

Owning cars, large houses, or swimming pools mean different things in different cultures and may confuse a visitor to the United States. (a)In many nations, there is a “two-class system” in which privilege exists only when it is accompanied by wealth. In such societies, there are only two classes: rich and poor. Only the rich have such things as cars and swimming pools; the poor have very little.

By contrast, this is not true in the United States. Because of the successful American economy and general wealth of the country, the cost of certain things that only the rich can afford in other countries is relatively low. This means that laborers, farmers, and people who are not usually regarded as rich nevertheless have many possessions that only the rich have in other nations. Understandably, a visitor may assume that all Americans who own cars are as rich as people in his own country who own cars. Actually, (d)this is not the case; secretaries, university students, factory workers, or farmers can and do buy cars and many other “expensive” things. Generally, they pay for these possessions gradually, during a period of many months, or even years, (b)so that the cost each month is not too high in relation to their monthly wages.

This difference in the meaning of wealth and privilege from one country to another may cause additional confusion. A visitor may assume, for example, that owning a car or a house necessarily indicates high class and therefore education. As a result, he may expect to find that the owner of such goods is as cultured as the people in his own country who have such things. In America, while this may be true, it is not necessarily so. Money is frequently

earned very rapidly, and sometimes the people who spend the most money are neither educated nor cultured!

問1 下線部(i)は、どのようなことを意味していますか。その具体的な内容を日本語で説明しなさい。

問2 アメリカの社会と、その他の国々の社会との一般的な相違について、アメリカを訪れる人たちを当惑させるのは、どのような点ですか。100 字以内の日本語で要約しなさい。

問3 下線部(a)と(b)を和訳しなさい。

Lesson 4

次の英文を読んで、下線部(1),(2),(3)を和訳しなさい。

⁽¹⁾For most of us life assumes a different rhythm on the weekend; we sleep in, cut the grass, wash the car. We also go to the movies, especially during hot weather. We travel. And of course we exercise and play games. Some of these pastimes, like tennis, have an old history and a newfound popularity; others, like windsurfing and hang-gliding, are more recent. Most are distinguished from nineteenth-century recreations such as croquet and golf by their relative arduousness and even riskiness.

Although the weekend is a time for sports, for shopping, and for household chores, it is foremost a manifestation of the structure of our leisure. The chief *Oxford English Dictionary* definition of leisure is “time which one can spend as one pleases.” That is, “free” time. But in one of his popular columns in *The Illustrated London News* — a Saturday paper — G.K. Chesterton pointed out that leisure should not be confused with liberty. ⁽²⁾Contrary to most people’s expectations, the presence of the first by no means assures the availability of the second. This confusion arose, according to Chesterton, because the term “leisure” is used to describe three different things: “The first is being allowed to do something. The second is being allowed to do anything. And the third (and perhaps most rare and precious) is being allowed to do nothing.” The first, he acknowledged, was the most common form of leisure, and the one that of late — he was writing in the early 1890s — had shown the greatest quantitative increase. The second — the liberty to fashion what one willed out of one’s leisure time — was more unusual and tended to be the province of artists and other creative individuals. ⁽³⁾It was the third, however, that was obviously his favorite, because it allowed

idleness — in Chesterton's view, the truest form of leisure.

[Note]	pastime: 気晴らし	newfound: 新発見の
	arduousness: 厳しさ	chore: 雑用
	foremost: 第一に	manifestation: 現れ
	acknowledge: 認める

次の英文について設問に答えよ。

“Eat a good breakfast to start a good day” is more than an easy-to-remember slogan; it suggests a practice that research has proved to be effective. Studies have shown that (1)students who eat an adequate breakfast are more alert and accomplish more than do those who neglect the morning meal.

(2)Of course now and then a young person may get up late and have to skip breakfast or eat a very poor one. (3)If this happens rarely, little harm is done. But a regular habit of skipping breakfast or eating an inadequate one can be harmful.

There can be a twelve- to fourteen-hour period between supper and breakfast. Then if a person misses breakfast, another four or five hours of fasting is added. A person who has gone without food for sixteen to eighteen hours or so cannot expect to have a full amount of energy for the day's work.

(4)The body is not like a machine that stops running when the fuel tank is empty. When the body needs refueling, it must cut down on whatever activities it can while still maintaining many life processes. Thus the body in need of fuel has to borrow from its cells, and “make do” until food supplies arrive. When the body is in need of food, it functions in a below-standard way. Feelings of fatigue and discouragement often occur — just because a person needs food.

Breakfast is essential for a good start on the important job of getting all the nutritious foods needed to supply an adequate daily diet. If a person eats a poor breakfast, or none at all, he places a special burden on the other meals to supply extra amounts of important nutrients needed. Studies show, in fact,

that ⁽⁵⁾the young person who skips breakfast does not usually make up later in the day for the nutrients that were missed, especially vitamin C and calcium.

[Note] nutritious: 栄養分に富む
